

MOBILE APP FOR TRANSPORTATION COMPANY

Versta - transportation company from Vologda. On the market since 2009, offering intercity trucking, passing trucking, long distance domestic travel.

Objective

The goal was creating an app enabling passengers to call a passenger or a cargo taxi, on the one hand, and carriers to receive orders from customers onto their mobile devices, on the other hand. For making the service up and running it was required to engineer a passenger and driver rating system per mutual assessments according to the results of each ride or carriage.

Solution

We came up with Android and server apps enabling the passenger to:

Call up a passenger or cargo taxi right to the address indicated automatically on the app or as corrected by the passenger himself

Get information about available transport and choices

Filter cargo transport per tonnage

Assess the driver

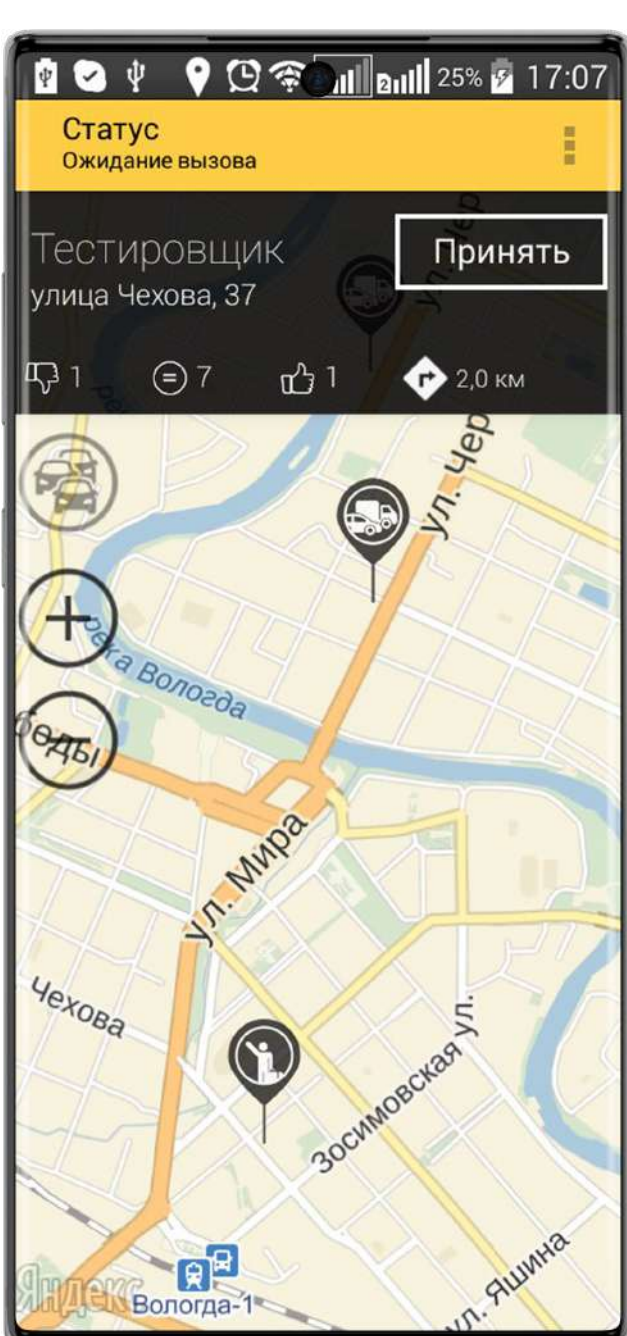

Track down transport on a map

Make a phone call to the driver

Announce a taxi arriving

Key features

Receive orders onto their mobile devices and see the customers on a map

Choose a passenger per his rating status

Assess the passenger

Make a phone call to the passenger
